PROFILE

Software developer passionate about reproducible science and clean, scalable code

EDUCATION

Carnegie Mellon University
MSc, Computational Biology
2019-2021

Carleton College
BA, Biology
2012-2016

SKILLS

Python | Rust | Shell | SQL | HTML/CSS | Javascript | CI/CD | Git | Linux | Docker | Numpy | Pandas | Pytorch | Scikit-learn | Cloud Computing, esp GCP | Data Engineering

Languages
- English (native)
- French (conversational)

SELECTED COURSEWORK

- Machine Learning for Scientists
- Neural Networks for NLP
- Biomedical Image Analysis
- Algorithms and Advanced Data Structures

EXPERIENCE

Software Engineer
Becton Dickinson and Co. Genomics
Feb 2018 - Jul 2019

- Maintained and developed new features for the BD Rhapsody Single-Cell Analysis System with data science tooling and modern deployment practices
- Analyzed unusual and novel genomic datasets for customers and internal scientists
- Independently designed and implemented analysis software for a new product line
- *Tech Stack:* Python, Javascript, Docker, CWL
- *Key achievement:* removed bottlenecks from a core data analysis pipeline using algorithmic techniques and cloud infrastructure tuning, dramatically reducing AWS costs

Research Assistant
Anderson Lab of University of California, San Francisco
Oct 2016 - Aug 2017

- Executed and analyzed RNAseq and flow cytometry experiments related to autoimmune disease
- *Tech Stack:* Python, R

RECENT PROJECTS

icd-codex.py
- Built and maintain a library for computational embedding of health insurance codes with 100s of downloads a month
- Originally pitched for John Hopkins “Medhacks” 2020, which won 1st place, winning $3,000

fainhD (filtering and identifying non-host DNA pipeline)
- As technical lead, constructed a pipeline for identifying viruses in RNAseq datasets using Snakemake
- Deployed on the PSC (Pittsburgh Supercomputering Center) bridges2 supercomputer to demonstrate computational reproducibility
